                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to nucleic acid molecules encoding non-aggregating chromo/fluorescent proteins and their mutants. Chromo/fluoro proteins are useful in analyte detection assays, as colouring agents, as markers in recombinant DNA applications, as sunscreens or filters, in fluorescence resonance energy transfer (FRET) applications, as biosensors in prokaryotic and eukaryotic cells, in screening assays, as second messenger detectors, in fluorescence activated cell sorting applications, in protease cleavage assays or as fluorescent timers. The present sequence is Discosoma sp. drFP583/dmFP592 (6/9Q) protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid encoding a non-aggregating chromo- or fluorescent mutant of an aggregating Chidarian chromo- or fluorescent protein or mutant for analyte detection assays or fluorescence activated cell sorting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  fluorescence activated cell sorting application; fluorescent timer; blosensor; fluorescence resonance energy transfer application; PRET; colouring agent; recombinant DNA application; analyte detection assay; sunscreen; second messenger detector; drFP583 protein; dmFP592 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is derived from humanised hybrid protein CC drPp583/dmPp592 drPp583 is a full-length cDNA encoding a novel CC fluorescent protein (nPP) from Discosoma sp. "red", a non-bioluminescent CC species of the Class Anthozoa. The hybrid sequence was changed to CC optimise the codons for expression of the protein in mammalian cells. The CC optimise the codons for expression of the protein in mammalian cells. The CC incorporated by random mutagenesis. Fluorescent proteins can be used in CC fluorescent labeling, a useful tool for marking a protein, cell or CC companism of interest. Unlike other markers used in protein labeling, such CC can be used in corporated by candom account tool for marking a protein colling, such CC can exogenous cofactor or substrate. Methods involving fluorescent cC craditional methods of fluorescent labeling, where a protein of interest CC proteins are also less laborious and less difficult to control than the CC proteins are also less laborious and less difficult to control than the CC proteins are also less laborious and less difficult to control than the CC proteins are also less laborious and less difficult to control than the CC proteins are also less laborious and less difficult to control than the CC proteins are also less laborious and less difficult to control than the CC protein are also less laborious and less difficult to control than the CC proteins are also less laborious and less difficult to control than the CC proteins are also less laborious and less difficult to control than the CC proteins are also less laborious and less difficult to control than the CC proteins are also less laborious and less difficult to control than the CC proteins and then covalently conjugated to a fluorescence derivative.

CC novel fluorescence proteins isolated from species of the Class Anthozoa CC and be used as markers for gene expression and protein localization.

CC proteins and the covalent are fluorescence protein localization.

Chromo/fluoro proteins are useful in analyte detection assays, as colouring agents, as markers in recombinant DNA applications, as sunscreens or filters, in fluorescence resonance energy transfer (FRET) applications, as biosensors in prokaryotic and eukaryotic cells, in screening, as subsensors in prokaryotic and eukaryotic cells, in screening, as biosensors in prokase cleavage assays or as fluorescence timers. The present in protease cleavage assays or as fluorescent timers. The present in gequence is Discosoma sp. drFP583/dmFP592 (6/90) mutant protein of the invention. Note: This sequence is not shown in the specification, but is derived from Discosoma sp. drFP583/dmFP592 (6/90) wild-type protein shown as SEQ ID NO:12 (AAE28835) in page 72-73 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fluorescent protein; chromoprotein; protease cleavage assay; filter; fluorescence activated cell sorting application; fluorescent timer; biosensor; fluorescence resonance energy transfer application; FRET; colouring agent; recombinant DNA application; analyte detection assay; sunscreen; second messenger detector; drFP583 protein; dmFP592 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Discosoma sp.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       문
                                                            The invention relates to nucleic acid molecules encoding non-aggregating chromo/fluorescent proteins and their mutants. Chromo/fluoro proteins are useful in analyte detection assays, as colouring agents, as markers in recombinant DNA applications, as sunscreens or filters, in fluorescence resonance energy transfer (FRET) applications, as biosensors in protearyotic and eukaryotic cells, in screening assays, as second messenger detectors, in fluorescence activated cell sorting applications, in protease cleavage assays or as fluorescent timers. The present sequence is Discosoma sp. drFP583/dmFP592 (6/9Q) mutant protein of the invention. Note: This sequence is not shown in the specification, but is derived from Discosoma sp. drFP583/dmFP592 (6/9Q) wild-type protein shown as SEQ ID NO:12 (AAE28835) in page 72-73 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid encoding a non-aggregating chromo- or fluorescent mutant of an aggregating Chidarian chromo- or fluorescent protein or mutant for analyte detection assays or fluorescence activated cell sorting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fluorescent protein; chromoprotein; protease cleavage assay; filter; fluorescence activated cell sorting application; fluorescent timer; biosensor; fluorescence resonance energy transfer application; FRET; colouring agent; recombinant DNA application; analyte detection assay;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          맑
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          á
The present sequence is derived from humanised hybrid protein CC drep583/dmFP592. drFP583 is a full-length cDNA encoding a novel CC drep583/dmFP592. drFP583 is a full-length cDNA encoding a novel CC fluorescent protein (nFP) from Discosoma sp. "red", a non-bioluminescent Species of the Class Anthozoa. The hybrid sequence was changed to Optimise the codons for expression of the protein in mammalian cells. The CC which were incorporated by random mutagenesis. Fluorescent proteins can CC be used in fluorescent labeling, a useful tool for marking a protein, CC cell or organism of interest. Unlike other markers used in proteins CC labeling, such as beta-galactosidase and luciferase, fluorescent proteins CC do not require an exogenous cofactor or substrate. Methods involving CC fluorescent proteins are also less laborious and less difficult to control than the traditional methods of fluorescent labeling, where a CC protein of interest is purified and then covalently conjugated to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            fluorophore derivative. Novel fluorescent proteins isolated from species of the Class Anthozoa can be used as markers for gene expression and protein localization studies, and in fluorescence resonance energy transfer (FRET) reactions. They may have improved properties and better suitability for larger excitations compared to prior art fluorescent proteins such as green fluorescent protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fluorescent protein; chromoprotein; protease cleavage assay; filter; fluorescence activated cell sorting application; fluorescent timer; biosensor; fluorescence resonance energy transfer application; FRET; colouring agent; recombinant DNA application; analyte detection assay; sunscreen; second messenger detector; drFP583 protein; dmFP592 protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to nucleic acid molecules encoding non-aggregating chromo/fluorescent proteins and their mutants. Chromo/fluoro proteins are useful in analyte detection assays, as colouring agents, as markers in recombinant DNA applications, as sunscreens or filters, in fluorescence resonance energy transfer (FRET) applications, as biosensors in prokaryotic and eukaryotic cells, in screening assays, as second messenger detectors, in fluorescence activated cell sorting applications, in protease cleavage assays or as fluorescent timers. The present sequence is Discosoma sp. drFP593/dmFP592 (6/90) mutant protein of the invention. Note: This sequence is not shown in the specification, but is derived from Discosoma sp. drFP593/dmFP592 (6/90) wild-type protein shown as SEQ ID NO:12 (AAE28835) in page 72-73 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid encoding a non-aggregating chromo- or fluorescent mutant of an aggregating Chidarian chromo- or fluorescent protein or mutant for analyte detection assays or fluorescence activated cell sorting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is a novel fluorescent protein (dmPP592) from Discosoma sp.

"magenta", a non-bioluminescent species of the genera Anthozoa. The
fluorescent colour is observed under usual white light or ultraviolet
light. It has an absorbance maximum at 573 nm and an emmision maximum at
593 nm. The polynucleotides of the invention can be used to produce the
proteins recombinantly, and as a source of primers and probes for
identifying related proteins. The fluorescent proteins have applications
in fluorescent labeling, as fluorescent markers for gene expression and
protein localization studies, and in fluorescence resonance energy
transfer (FRET) reactions. They may have improved properties and better
suitability for larger excitations, compared to prior art fluorescent
proteins such as green fluorescent protein from Aequorea victoria, which
has an excitation maximum at 395 nm, a second excitation peak at 475 nm
c and an emission maximum at 510 nm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is Discosoma sp. magenta fluorescent protein dmFP592. It was isolated using the Aequoria victoria green fluorescent protein (GPP) sequence, which was used to design PCR primers which might isolate other fluorescent proteins from a number of species of Anthozoa. These were Anemonia majano, Clavularia sp., Zoanthus sp., Discosoma sp. and Anemonia sulcata. The CDNA obtained was then screened in the search for sequences encoding fluorescent proteins. The other proteins found in this manner were CFP494, zFP506, zFP538, dFP593, dsFP483, asFP600, dgFP512 and amFP486. These proteins can be used as fluorescent labels (for gene expression and protein localisation studies and in fluorescence resonance energy transfer (FRET) studies) in place of fluorophore derivatives and luciferases, as these involve laborious processes and the latter require cofactors. They can also be used in place of GFP, which is too stable to be useful when studying short-term or repetitive events
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Anthozoa; Chromoprotein; fluorescent protein; dmFP592; NFP-9; sunscreen; analyte detection assay; selectable marker; recombinant DNA application;

                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is a Discosoma sp. magenta chromo/fluorescent protein, dmFP592 (NFP-9). NFP-9 is present in an environment other than its natural environment and has an absorbance maximum ranging from 375nm to 775nm and more usually from 560nm to 590nm and emission maximum ranging from 395nm to 795nm and more usually from 580 to 610nm. The chromoproteins or fluorescent proteins are useful as labels in analyte detection assays, as selectable markers in recombinant DNA applications, as biosenseors in prokaryotic and eukaryotic cells e.g. as pH indicator and as in vivo markers in animals. They are also useful in sunscreens an as selective filters. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            An Anthozoa chromo- or fluorescent protein (other than its natural environment, useful a detection assays and as a selectable marker

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or compressing a polypeptide which, in a cell, alone or together with one or compression coloured coloured singarts an altered visual characteristic to the cell coloured their molecules emission. CFMs are useful for producing a cc transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant cc extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional clight for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car cupholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, cc expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs embedded in a gel matrix improve image quality in cg situations of distorted light spectra (biomatrix). The first all-protein cc chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABP69924-ABP70048 represent CFM related amino acid sequences. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         음 성
                                                                                                                                                                         The present invention describes a eukaryotic chromosome (I) comprising cone or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of call lambda-integrase. Also described: (1) a platform artificial chromosome catalysed recombination; and (2) a method (M1) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (M1) is useful for cartificial chromosome, preferably an ACes. (II) is useful for cartificial chromosome, preferably an ACes. (II) is useful for cartificial chromosome, preferably an ACes. (II) is useful for cartificial chromosome, preferably an ACes. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or carminated cartier system, microinjection, microcall fusion, electroporation, by a carrier system, microinjection, microcall fusion, electroporation, carrier system, microinjection, microcall fusion, electroporation, call, preferably a stem cell or an embryo. (II) comprises a heterologous call, preferably a stem cell or an embryo. (II) comprises a heterologous call cacid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a Discosoma sp. red chromo/fluorescent protein, cc drpp583 (NFP-6). NFP-6 is present in an environment other than its cc natural environment and has an absorbance maximum ranging from 250nm to 750nm and more usually from 540nm to 580nm and enission maximum ranging cc from 275nm to 775nm and more usually from 565 to 605nm. The cromoproteins or fluorescent proteins are useful as labels in analyte cd detection assays, as selectable markers in recombinant DNA applications, cc as biosensors in prokaryotic and eukaryotic cells e.g. as pH indicator cc and as in vivo markers in animals. They are also useful in sunscreens and cc as elective filters. Note: The specification also refers to following cmutants of this sequence: (a) E5 with substitutions V105A and S197T, (b) E5down with substitution S197T, (c) E5T with substitutions V105A, I161, cc Substitutions V11M, V105A, V120H and S197T.                                                                                                                                                                                                                                                                                                                                   The present sequence is a Discosoma sp. red chromo/fluorescent protein, drPp583 (NFP-6) mutant E5up (V105A). NFP-6 is present in an environment other than its natural environment and has an absorbance maximum ranging from 250nm and more usually from 540nm to 580nm and emission maximum ranging from 275nm to 775nm and more usually from 540nm to 580nm and emission fine chromoproteins or fluorescent proteins are usually from 565 to 605nm. The chromoproteins or fluorescent proteins are usually from 565 to 605nm. analyte detection assays, as selectable markers in recombinant DNA applications, as biosensors in prokaryotic and eukaryotic cells e.g. as pH indicator and as in vivo markers in animals. They are also useful in sunscreens and as selective filters. Note: The present sequence is not shown in the specification, but derived from drFP583 (NFP-6) sequence (AAE00375) shown in figure 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          14-JUN-2000;

                                                                             The present sequence is a Discosoma sp. red chromo/fluorescent protein, drFP583 (NFP-6) mutant E8 (N42H). NFP-6 is present in an environment other than its natural environment and has an absorbance maximum ranging from 250nm to 750nm and more usually from 540nm to 580nm and emission maximum ranging from 275nm to 775nm and more usually from 565 to 605nm. The chromoproteins or fluorescent presents are useful as labels in analyte detection assays, as selectable markers in recombinant DNA applications, as biosensors in prokaryotic and eukaryotic cells e.g. as bi midicator and as in vivo markers in animals. They are also useful in sunscreens and as selective filters. Note: The present sequence is not shown in the specification, but derived from drFP583 (NFP-6) sequence (AAE00375) shown in figure 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             10-DEC-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δ
The invention describes a polynucleotide sequence (I) encoding a CC Discosoma red fluorescent protein (DsRed) variant having a reduced CC propensity to oligomerise, comprising amino acid substitutions at the AB CC and/or AC interfaces of the wild-type DsRed sequence (S1) comprising 225 CC amino acids, given in the specification, where the substitutions result in reduced propensity of the DsRed variant to form tetramers. (I) is CC useful for detecting transcriptional activity by providing a host cells CC conatining a vector which comprises (I) operatively linked to an CC expression control sequence, and an unit to assay the variant fluorescent protein fluorescence, and assaying fluorescence of the variant fluorescent protein produced by (VII), where variant fluorescent protein protein is useful for the analysis of in vivo localisation or trafficking of a polypeptide of interest.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC marker is useful as markers to identify the location and amount of a CC target protein produced, where the target protein is fused to the marker, CC as a complement to or alternative for the green fluorescent protein or CC its spectral variant, for detecting induction of transcriptions, in CC which detects events as the function of the movement to fluorescent (FRET), which detects events as the function of the movement of fluorescent CC donors and acceptors towards or away from each other, for making CC indicators for ions and molecules such as Ca2+, Zn2+, for identifying the CC indicators for ions and molecules such as Ca2+, Zn2+, for identifying the CC interaction of a first and second molecule, for identifying a specific CC interaction of a first and second molecule, for determining whether a CC sample contains an enzyme or for determining the pH of the sample. (I) is CC useful for identifying a region or condition that regulates the activity of an expression control sequence. This is the amino acid sequence of CC Discosoma red fluorescent protein variant mRFP1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a polynucleotide sequence encoding a Discosoma red fluorescent protein (DsRed) variant having a reduced propensity to oligomerize. The protein variant comprises one or more amino acid substitutions at the AB and/or AC interface(s) of the wild-type DsRed sequence, where the substitutions result in reduced propensity of the part of the substitutions result in reduced propensity of the part of the substitutions result in reduced propensity of the part of the fluorescence of at least one red wavelength. The composition and methods are useful in producing red fluorescent proteins having reduced propensity for oligomerization, especially tetramerization. The protein may be used in molecular biology and in other scientific applications, such as in immunoassays or hybridization assays, or in tracking the movement of proteins in cells. This sequence corresponds to the DsRed

                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                            ঠ
                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                           ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC protein fragment is fused to a separate molecule. Also described are: CC protein fragment complementation assays (PCAs) for detection of molecular interactions, involving reassembling separate fragments from an optically detectable protein, and detecting the reassembly by units of reconstitution of activity of the optically detectable protein, where the creassembly of the fragments is operated by the interaction of molecular commanism fused to each fragment, and is independent of other molecular compropriate optically detectable protein, effecting involving selecting an cappropriate optically detectable protein such that the fragmentation results in creversable loss of protein function, finsing or attaching fragments of the optically detectable protein separately to other molecules, reassociating the protein fragments through interactions of the molecules, reassociating companies, designing and engineering of PCAs based on fluorescent protein; and a method and composition for the construction of multi-color PCAs. (I) is useful in PCAs and other assays for drug discovery, target conspling, drug mechanism-of-action studies, biosensors and diagnostics. (CI) is useful for engineering different colour PCAs for applications in biology and biotechnology. This is the amino acid composition of applications in biology and biotechnology. This is the amino acid composition of isolated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                        The invention relates to a polynucleotide sequence encoding a Discosoma red fluorescent protein (DsRed) variant having a reduced propensity to oligomerize. The protein variant comprises one or more amino acid substitutions at the AB and/or AC interface(s) of the wild-type DsRed sequence, where the substitutions result in reduced propensity of the BBRed variant to form tetramers and where the variant displays detectable fluorescence of at least one red wavelength. The composition and methods are useful in producing red fluorescent proteins having reduced propensity for oligomerization, especially tetramerization. The protein may be used in molecular biology and in other scientific applications, such as in immunoassays or hybridization assays, or in tracking the movement of proteins in cells. This sequence corresponds to the DsRed variant mRFFP1.1 protein which contains a Q66M and a T147S mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   red fluorescent protein; DsRed; fluorescence; red wavelength; oligomerization; tetramerization; immunoassay; hybridization assay.
                                                                                                                                                                                                                                                                                                                             Sequence 225 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pred. No. is the number of results predicted by chance to have score greater than or equal to the score of the result being pand is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1214

President grotal structure of DsRed, a red fluorescent protein from coral, at 2.0-A resolution.";

Proc. Natl. Acad. Sci. U.S.A. 98:462-467(2001).

-- FUNCTION: Thought to play a role in photoprotection of the coral's resident symbiont microalgae's photosystems from photoinhibition caused by high light levels found near the surface of coral reefs. In deeper water, the fluorescence may be to convert blue light in the surface of coral reefs.
                                                                                                                                                                                                                                                                                                                                                                                          3D-structure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       requires nothing other than molecular oxygen.

BIOTECHNOLOGY: Fluorescent proteins have become a useful and ubiquitous tool for making chimeric proteins, where they function as a fluorescent protein tag. Typically they tolerate N- and C-terminal fusion to a broad variety of proteins. They have been expressed in most known cell types and are used as a noninvasive fluorescent marker in living cells and organisms. They enable a wide range of applications where they have functioned as a cell lineage tracer, reporter of gene expression, or as a measure of protein-protein interactions.

SIMILARITY: Belongs to the GFP family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUBUNIT: Homotetramer.

PTM: Contains a chromophore consisting of modified amino acid residues. The chromophore is formed by autocatalytic backbone residues. The chromophore is formed by autocatalytic backbone condensation between Xaa-N and Gly-(N+2), oxidation of Tyr-(N+to didehydrotyrosine, and formation of a double bond to the all amino nitrogen of residue Xaa-N. Maturation of the chromophore
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the microalgal symbionts.

   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DB seq length: 0

GENERAL INFORMATION:
GENERAL PERMOTER OF THE UNIVERSITY OF CALIFORNIA

APPLICANT: The REGENTS OF THE UNIVERSITY OF CALIFORNIA

APPLICANT: Baird, Geoffrey

TITLE OF INVENTION: CHRCULARLY PERMUTED FLUORESCENT PROTEIN INDICATORS

PILE REFERENCE: REGEN1470-1

CURRENT APPLICATION NUMBER: US/09/999,745

CURRENT FILING DATE: 2001-10-23

PRIOR APPLICATION NUMBER: 09/316,920

PRIOR APPLICATION NUMBER: 09/316,920

PRIOR APPLICATION NUMBER: 09/316,920

PRIOR OF SEQ ID NOS: 67

SOFTWARE: PatentIn version 3.0

SEQ ID NO 67

LENCTH: 225

TYPE: PRT

CRGANISM: Discosoma sp.
